Dear Daniel,

I am Carmen Salazar, a first year sociology student in the PhD program at the University of CA, Merced. This semester I am taking a graduate statistics course taught by Dr. Charlie Eaton and as an assignment I need to contact authors whose quantitative methods and data source I think could be repurposed for my own research project. I have been working with Dr. Tanya Golash-Boza on a research project focused on gentrification, more specifically, whether the qualitative Google Street View captures gentrification in Washington D.C. I have conducted extensive literature review, compared Google Street View with Census data, and created a comparison of qualitative and quantitative measures of gentrification. I have come across your literature on "A Model for Identifying Gentrified Areas with Census Data" and believe your quantitative methods could help me answer questions related to my own research questions. Therefore, I was wondering if you would be willing to share your source data and or analysis code.

Thank you for your time.

Carmen
